

From email: "Today I drove down Taylor fork road, with the thought of potentially getting up on Woodward mtn, until I saw a crown on the NE

Face of its northern summit, basically wall to wall near the top of the slide path. There were a couple other sled tracks that also went to the end of the road, so I figured maybe it was pretty recent, as I didn't hear about it in the advisory. Concerning because it appears to have propagated maybe 250ft across, while maybe only 1-2 ft deep".
